```
The present invention relates to use of mechano-growth factor (MGF), an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve
                                                                                                                                                                                                                                     avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, eg., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive poliomyelitis or post-polio syndrome, a disorder caused by exposure to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rabbit; IGF-I isoform; Insulin-like Growth Factor-I; MGF; mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral sclerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-polio syndrome; toxin; motoneurone disorder; nerve damage; autosomal muscular dystrophy; diabetic neuropathy; sex-linked muscular dystrophy; peripheral neuropathy; Alzheimer's disease; Parkinson's disease.
               Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -
                                                                                                                                                                                                                                                                                                                                                                                    toxin, motoneurone trains, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with agi autosomal or sex-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is human IGF-I isoform MGF. MGF is a muscle isoform having extracellular (EC) domain, hence also referred as IGF-I.EC. The MGF protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4, 5 and 6 in the reading frame
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 60

The present invention relates to use of mechano-growth factor (MGF),
an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a
medicament for the treatment of neurological disorder. The MGF is capable.
Cof reducing motoneurone loss by 20% or greater in response to nerve
avulsion, and effects motoneurone rescue, preferably adult motoneurone
cof rescue. The MGP polynucleotide and polypeptide are useful in the
manufacture of a medicament for the treatment of a neurological disorder,
including a disorder of motoneurones and/or neurological disorder,
cof amyotrophic lateral sclerosis, spinal muscular atrophy,
cof spinal muscular atrophy, infantile or juvenile mescular atrophy,
cof poliomyelitis or post-polio syndrome, a disorder caused by exposure to
compare that affects motoneurone lesion or nerve damage, an
injury that affects motoneurones, motoneurone loss associated with aging,
cattosomal or sex-linked muscular dystrophy, diabetic neuropathy,
cattosomal or sex-linked muscular dystrophy, diabetic neuropathy,
cof peripheral neuropathies, Alzheimer's disease and Parkinson's disease.
Cof The present sequence is rabbit GFO isoform MGF. MGF is a muscle
cisoform having extracellular (EC) domain, hence also referred as
cof sequence of IGF-I exons 4, 5 and 6 in the reading frame
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1;

                                                                                                                                                                                                                                                                                                                                  1;
                                                                                                                A use of insulin like growth factor I (IGF-1) has been developed, and is characterised by the presence of the Ec peptide, or a functional equivalent, in the treatment or therapy of a human or animal. The IGF-1 polypeptide can be used to treat muscular disorders, e.g. Duchenne or Becker muscular dystrophy, autosomal dystrophies and related progressive skeletal muscle weakness and wasting, muscle atrophy in ageing humans, spinal cord injury induced muscle atrophy and neuromuscular diseases, and cardiac disorders, e.g. diseases where promotion of cardiac muscle protein synthesis is a beneficial treatment, cardiomyopathies and acute heart failure or insult, specifically myocarditis or myocardial infarction. It can also be used to promote bone fracture healing and maintenance of bone in old age. The present sequence represents rabbit IGF-1 used in the present specification.

The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult.motoneurone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral sclerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-polio syndrome; toxin; motoneurone disorder; nerve damage; autosomal muscular dystrophy; diabetic neuropathy; sex-linked muscular dystrophy; peripheral neuropathy; Alzheimer's disease; Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -
A 42 base oligonucleotide corresponding to the DNA sequence encoding amino acids 10 to 23 of mature human IGF-I was synthesized (AAN70437). The radiolabelad 42 mar was then employed to screen for IGF-I containing DNA sequences in a human liver CDNA library. Insulin-like growth factors-1A and -1B cDNAs were isolated from a human cDNA library by using lambdagt 11 (AAN70435, AAN70436). The human IGF-I genomic gene was isolated and mapped. It encodes at least two preproinsulin-like growth factor-1 proteins. An essentially pure proproinsulin-like growth factor-1 protein comprising the sequence of amino acids shown in Figure six is claimed (AAP70277).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                49 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 108

Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -

Disclosure; Fig 8; 66pp; English.

The present invention relates to use of mechano-growth factor (MGF),

ö an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, policomyelitis or post-polio syndrome, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging, autosomal or sex-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is human liver-type IGF-I isoform (L.GF-I). The L.IGF-I protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4 and 6. The invention relates to modulating long term memory consolidation in an animal comprises treating with an agent that modulates the activity of one or more of genes from zif268, insulin-like growth factor (IGF), glutamate receptor 1 (GluR1), glutamate receptor 2 (GluR2), c/EBPBDeta and neuroendocrine VGF (neurotropin-inducible gene). The method is useful for identifying an agent which modulates memory consolidation. The method is useful for conducting a drug and/or target discovery business, which comprises conducting therapeutic profiling of the agents (or their analogues) identified, for efficacy and toxicity in animals, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cancer;

The amino acid sequence of the insulin-like growth factor 1 pre-protein. Processing of the protein results in a 70 amino acid mature protein. The mature protein is split into 4 domains: the B domain has strong homology to the B chain of insulin, the A domains: the B domain has strong homology to the B chain of insulin. These domains are separated by a C domain and the Chain of insulin. These domains are separated by a C domain and the Commain sequence was used to synthesis peptides (AARB3801-2) that include amino acid residues 60-64 of the mature IGF-1 protein. IGF-1 binds to the IGF-1 receptor (IGF-1R) via the D domain and induces activation of the IGF-1 R by autophosphorylation of the IGF-1R.

Activated IGF-1R is associated with cellular growth and proliferation. The Synthetic peptides are useful as inhibitors of IGF-1R.

The synthetic peptides are useful as inhibitors of IGF-1 binding to IGF-1R and thus may be used in the treatment of disorders characterised by undesirable cell proliferation eg. cancer, restenosis, asthma, burns,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               IGF-I; insulin-like growth factor I; skeletal alpha-actin gene promoter; muscle atrophy; diabetes; osteoporosis; growth disorder; therapy; AIDS; Chacot-marie-tooth disease; atherogenesis; haemophilia; neuropathy.
                                                                                                                                                                                                                                                                                                                                                                                             A method has been developed of treating urinary incontinence (UI) in mammals. The method comprises delivering a nucleic acid vector for the expression of a growth factor or neurotrophic factor in a tissue or tissues. The present sequence represents human IGF-1 (insulin-like growth factor 1) which is used in the method of the invention. Due to the growth and stimulatory effects of growth factors and neurotrophic factors, introducing these factors to degenerated muscles in the urinary system can improve UI by enhancing both their integrity and neural innervation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  49 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 108

This sequence is the invalid factor of the invention, for expression of a nucleic acid sequence in a cell, which comprises: (a) a nucleic acid cassette containing a sequence encoding IGF-I; (b) a 5' flanking region including one or more sequences necessary for expression of the nucleic acid cassette, including a promoter from a skeletal alpha-actin gene; (c) a linker connecting the 5' flanking region to a nucleic acid, the coll cassette, including a promoter from a skeletal alpha-actin gene; (c) a linker connecting the 5' flanking region to a nucleic acid, the lacking the coding sequence of a gene with which it is naturally associated; and (d) a 3' flanking region, including a 3' untranalated cassociated; and (d) a 3' flanking region, including a 3' untranalated cassociated; and (d) a 3' flanking region, including a 3' untranalated cassociated; and (d) a 3' flanking region, including a 3' untranalated cassociated; and (d) a 3' flanking region, including a 3' untranalated cassociated; and growth hormone 3'-upr. The vector can provide for efficient IGF-I expression, particularly in gene therapy. It can be used for the delivery of IGF-I for treating diseases such as muscle atrophy, clanberes, neuropathy, osteoporosis, and growth disorders. They can be used for treating peripheral neuropathies resulting from diabates, class casc disease such as Type I or Type II diabates, atherosciertic, cardiovascular, cerebrovascular, or peripheral vascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      49 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 108

                                                                                                           progressive
                                               A use of insulin like growth factor I (IGP-1) has been developed, and is characterised by the presence of the Ec peptide, or a functional equivalent, in the treatment or therapy of a human or animal. The IGF-1 polypeptide can be used to treat muscular disorders, e.g. Duchenne or Becker muscular dystrophy, autosomal dystrophies and related progressive skeletal muscle weakness and wasting, muscle atrophy in ageing humans, shall a muscle weakness and wasting, muscle atrophy in ageing humans, spinal cord injury induced muscle atrophy and neuromuscular diseases, and cardiac disorders, e.g. diseases where promotion of cardiac muscle protein synthesis is a beneficial treatment, cardiomyopathies and acute heart failure or insult, specifically myocarditis or myocardial infarction. It can also be used to promote bone fracture healing and maintenance of bone in old age. The present sequence represents human IGF-1 Ba isoform used in the present specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -

medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive conjoury that affects motoneurone, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging, putcomal or sex-linked muscular dystrophy, diabetic neuropathy, perspect of property is an expensive sequence is rabbit liver-type IGF-I isoform (L.IGF-I).

The L.IGF-I protein comprises amino acid sequences encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The L.IGF-I protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4 and 6.

Note: The present sequence (SEQ ID NO: 14) is stated as being the same as that shown in figure 10 (AAE02456) of the specification. However it differs at few positions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                              15 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDHRLEMY 74
                                                         The sequence is human prepro-somatomedin-C. DNA probes prepared against DNA encoding the protein sequence may be used to detect the presence of the genes in a natural source. The probes may be used to detect mutations and/or deletions in humans suffering from growth deficiencies. See also AAN60489, AAN60491

The present invention relates to use of mechano-growth factor (MGF),

an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a
medicament for the treatment of neurological disorder. The MGF is capable

of reducing motoneurone loss by 20% or greater in response to nerve

avulsion, and effects motoneurone rescue, preferably adult motoneurone

cavelsion, and effects motoneurone rescue, preferably adult motoneurone

cavelsion, and effects motoneurone rescue, preferably adult motoneurone

cavelsion, and effects motoneurones and/or neurodegenerative disorder,

including a disorder of motoneurones and/or neurodegenerative disorder,

cavelsion anyotrophic lateral sclerosis, spinal muscular atrophy,

poliomypelitis or post-polio syndrome, a disorder caused by exposure to a

compact of motoneurone, and anyotrophy, infantile or juvenile muscular atrophy,

compact of motoneurone or inconceurone lesion or nerve damage, and

injury that affects motoneurones, motoneurone loss associated with aging,

autosomal or sex-linked muscular dystrophy, diabetic neuropathy,

compact of sequence is alternative version of rabbit liver-type IGF-I

Environ. Mass Spectrom. 165.3-6(1988).

-!- FUNCTION: THE INSULIN-LIKE GROWTH PACTORE.

--- RUNCTION: THE INSULIN-LIKE GROWTH PACTORE.

--- SUBCELLULAR LOCATION: Secreted.

--- SUBCELLULAR LOCATION: Secreted.

--- ALTERNATIVE PRODUCTS: TWO FORMS OF IGF-1, IGF-IA AND IGF-IB ARE PRODUCED BY ALTERNATIVE SPLICING.

--- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sato A., Nishimura S., Ohkubo T., Kyogoku Y., Koyama S., Kobayashi M., Yasuda T., Kobayashi Y.; "IH-NMR assignment and secondary structure of human insulin-like growth factor-I (IGF-I) in solution."; J. "Sequences of liver cDNAs encoding two different mouse insulin-like
growth factor I precursors.";
Nucleic Acids Res. 14:7873-7882(1986).
-!- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA,
ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A
MUCH HIGHER GROWTH-PROMOTING ACTIVITY.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBCELLULAR LOCATION: Secreted.
-!- ALTERNATIVE PRODUCTS: I ISOFORM IGF-IA (AC POSO17) AND
-!- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.

Nakamura S., Niwa M., Zapf J.;

"Primary structure of rat insulin-like growth factor-I and its

biological activities.",

J. Biol. Chem. 264:5616-5621(1989).

-! FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA,

ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A

MUCH HIGHER GROWTH-PROMOTING ACTIVITY.

-! SUBCELLULAR LOCATION: Secreted.

-! SIBCELLULAR LOCATION: Secreted.

-! SIBCENDIAR IGF-IB (SHOWN HERE): ARE PRODUCED BY ALTERNATIVE SPLICING.

-! SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               49 GPETLCGAELVDALQFVCGPRGFYFNKPTGYGSSIRRAPQTGIVDECCFRSCDLRRLEMY 108

Environ. Mass Spectrom. 16:3-8(1988).

-I- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA, ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A WUCH HIGHER GROWTH-PROMOTING ACTIVITY.

-I- SUBCELLULAR LOCATION: Secreted.
-I- ALTERNATIVE PRODUCTS: TWO FORMS OF IGF-1, IGF-IA AND IGF-IB ARE PRODUCED BY ALTERNATIVE SPLICING.
-I- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                         Cooke R.M., Harvey T.S., Campbell I.D.;
